It is shown that the reaction products of diazomethane  
and zinc halides behave like the analogous aluminum  
compounds and do not represent a new type of compound.

It is demonstrated that the polymethylene from diazo-  
methane, described by H. Meerwein and W. Burneleit in  
1928 as well as by W. Werle in 1937, is identical as a  
class of material with the modern linear polyethylenes  
of higher density. The claim of American authors to  
have discovered this type of material in 1947 in the  
course of the polymerization of ethylene at 7000 atm.  
is, therefore, incorrect. (Author)

Dialkyl aluminum halides react with diazomethane with  
the formation of halogen methyl aluminum dialkyls.  
Their ethers are formed in ether. Methyl iodine-  
dialkyl aluminum can be separated as a solid; it  
decomposes above -100°. Compounds of this type react  
(in the absence of ether) already with alkenes and  
alkynes respectively below their decomposition temper-
